Features Completed:
- Website/CSS
- NavBar and pages created
- Website Layout
- Google Maps integration
- Find my location off IP
- Find my location off user input

Issues Faced:
- No API's to get data from UberEats/DoorDash/GrubHub
- The websites for UberEats/DoorDash/GrubHub are all loaded off of JavaScript, so scraping the data off the website with a webscraper will not work as planned. Need to find a workaround.

Suggestions:
- Static database with website info
- Selenium may work for scraping UberEats/DoorDash/etc, but it's complicated so it will take time
- Don't overcomplicate filters
- Get a database connected
